*Attorneys for Plaintiff Tigo Energy Inc.*

**UNITED STATES DISTRICT COURT  
NORTHERN DISTRICT OF CALIFORNIA**

## *San Francisco*

## **COMPLAINT**

Plaintiff Tigo Energy Inc. (“Tigo”) brings this Complaint for patent infringement against Defendant SunSpec Alliance (“SunSpec”) and alleges as follows:

## THE PARTIES

1. Tigo is a Delaware corporation, having its principal place of business at 655 Campbell Technology Pkwy., Campbell, CA 95008.

2. On information and belief and according to the records of the California Secretary of State website, SunSpec is a nonprofit corporation organized and existing under the laws of California with a principal place of business at 4040 Moorpark Avenue, Suite 110, San Jose, CA 95117.

## **JURISDICTION AND VENUE**

3. This action arises under the patent laws of the United States, Title 35 of the United States Code. Accordingly, this Court has exclusive subject matter jurisdiction over this action under 28 U.S.C. §§ 1331 and 1338(a).

4. This Court has personal jurisdiction over SunSpec because, on information and belief, SunSpec maintains its principal place of business in this District and from that location conducts and/or directs the acts accused of infringement in this action.

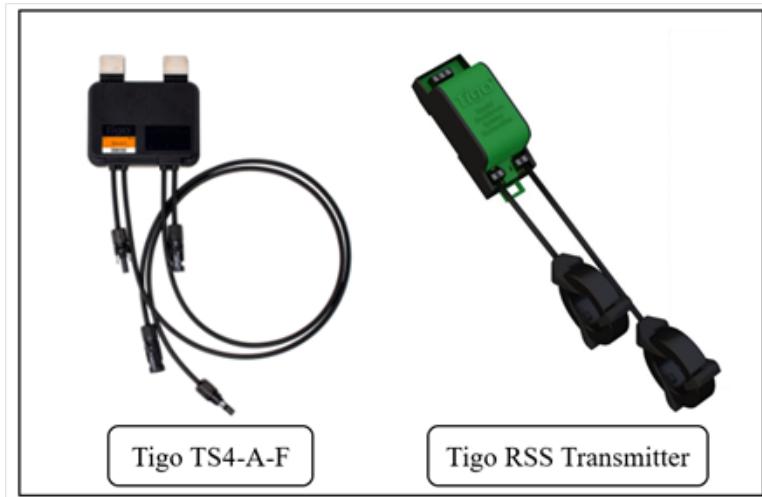

5. Venue is proper in this District pursuant to 28 U.S.C. §§ 1391 and 1400(b) because, on information and belief, SunSpec regularly conducts business within this District, has a regular and established place of business in this District, and has committed acts of infringement within this District.

## THE PARTIES

6. Tigo has been a leader for many years in developing technology for module-level rapid shutdown of photovoltaic panels.

7. Tigo's products include module-level rapid shutdown units that are attached to photovoltaic panels, such as its TS4-A-F product. The Tigo TS4-A-F works in conjunction with a transmitter, such as the Tigo RSS (Rapid Shutdown System) Transmitter, in order to provide a photovoltaic system that complies with the rapid-shutdown requirements of National Electric Code

§ 690.12. Tigo's TS4-A-F and RSS Transmitter rapid-shutdown products are pictured below:

8. Tigo has delivered more than 2 million rapid shutdown products to end users.

9. As a result of its pioneering work in developing technology for module-level rapid shutdown of photovoltaic panels, Tigo has obtained multiple patents related to module-level rapid shutdown.

10. U.S. Patent No. 8,933,321 (“321 patent”) is titled “Systems and methods for an enhanced watchdog in solar module installations,” and was duly and legally issued by the United States Patent and Trademark Office on January 13, 2015.

11. Tigo is the owner and assignee of all substantial rights in the '321 patent, a copy of which is attached as Exhibit 1.

12. SunSpec promotes itself as an information standards and certification organization for the Distributed Energy Resource industry. Various organizations are members or business partners of SunSpec, including SMA Solar Technology AG (“SMA”), Zhejiang Jiaming Tianheyuan Photovoltaic Technology Co., Ltd. (“JMTHY”), MidNite Solar, Inc. (“MidNite”), and Zerun Co., Ltd. (“Zerun”). SunSpec publicly touts its member companies, including as shown on the SunSpec website (<https://sunspec.org/members/>).

## **BACKGROUND**

13. National Electric Code § 690.12, “Rapid Shutdown of PV Systems on Buildings,” requires that photovoltaic system circuits “installed on or in buildings shall include a rapid shutdown function to reduce shock hazard for emergency responders.”

1       14. SunSpec has published specifications concerning rapid shutdown technology,  
 2 including the August 21, 2017 Communication Signal for Rapid Shutdown SunSpec  
 3 Interoperability Specification, Approved Version 34 (Exhibit 2 to this Complaint, hereinafter the  
 4 “RSD Specification”), and the March 9, 2021 Communication Signal for Rapid Shutdown Test  
 5 Specification, Version 18 (Exhibit 3, hereinafter the “RSD Test Specification”).

6       15. The RSD Specification is intended to meet and support the requirements set forth in  
 7 the national electric code, including as set forth in NEC 2014, NEC 2017, and UL 1741 relative to  
 8 module-level rapid shutdown requirements. (Ex. 2.)

9       16. Tigo’s work in the area of module-level rapid shutdown of photovoltaic panels far  
 10 pre-dates SunSpec. For example, the patent application that led to Tigo’s ’321 patent was filed in  
 11 2009, and was first published in 2010. This was many years before SunSpec began working on the  
 12 RSD Specification.

13       17. On information and belief, SunSpec developed and publishes the RSD Specification  
 14 with the intent that it be used by its members.

15       18. On information and belief, SunSpec provides testing and certification for the RSD  
 16 Specification that allows SunSpec members to obtain SunSpec certifications verifying that their  
 17 products adhere to the RSD Specification.

18       19. As described in more detail below, Tigo told SunSpec that a license to Tigo’s ’321  
 19 patent is needed for products that adhere the RSD Specification, and Tigo repeatedly asked SunSpec  
 20 to inform its members that a license is needed. SunSpec has refused to do so.

21       20. On information and belief, instead of telling its members that a license to Tigo’s  
 22 ’321 patent is needed to use the RSD Specification, SunSpec informed its members that they do not  
 23 need a license from Tigo because the ’321 patent is invalid. SunSpec has continued in this conduct,  
 24 including by issuing misleading emails to its members, press releases, and social media  
 25 announcements, despite having received a ruling from the U.S. Patent Office that unequivocally  
 26 rejected SunSpec’s position that Tigo’s ’321 patent is invalid.

27       21. In so doing, SunSpec is encouraging its members to practice at least claims 1 and 12  
 28 of Tigo’s ’321 patent with the specific knowledge and intent to cause SunSpec members adhering to

1 the RSD Specification to infringe those claims literally and under the doctrine of equivalents.

2 22. SunSpec is also willfully infringing at least claims 1 and 12 of the '321 patent by  
 3 testing and certifying products as compliant with the RSD Specification.

4 23. Tigo formally notified SunSpec in October 2017 that Tigo owned the '321 patent  
 5 and that at least claims 1 and 12 of the '321 patent are necessary to the RSD Specification.

6 24. On or about November 1, 2017, SunSpec publicly acknowledged Tigo's notice that  
 7 claims of the '321 patent are necessary to the RSD Specification in a "Member's Briefing."  
 8 SunSpec publicly repeated that acknowledgment by posting the slides from that meeting on its  
 9 website at [http://sunspec.org/wp-content/uploads/2019/08/RapidShutdown\\_IPbriefing20171101.pdf](http://sunspec.org/wp-content/uploads/2019/08/RapidShutdown_IPbriefing20171101.pdf).  
 10 A copy of the "Member's Briefing" slides is attached as Exhibit 4.

11 25. On February 14, 2020, Tigo's attorneys sent SunSpec a letter, explaining that Tigo  
 12 was willing to license its patents related to rapid-shutdown technology (including the '321 patent) to  
 13 SunSpec's members on reasonable and nondiscriminatory terms. A copy of the letter is attached as  
 14 Exhibit 5.

15 26. Instead of encouraging or facilitating conversations between its members and Tigo,  
 16 SunSpec published a "prior art synopsis" (see <https://sunspec.org/wp-content/uploads/2021/02/SunSpec-Rapid-Shutdown-Prior-Art-Synopsis-2021.pdf>). SunSpec's "prior art synopsis" document  
 17 states that its "purpose" is to establish that the technologies involved in the RSD Specification were  
 18 "invented or discovered years or even decades ago and are in the public domain." A copy of  
 19 SunSpec's "prior art synopsis" document is attached as Exhibit 6.

21 27. In a letter dated May 20, 2021, Tigo formally notified SunSpec that it was inducing  
 22 its members to infringe the '321 patent by encouraging them to import, make, use, sell, or offer to  
 23 sell products adhering to the RSD Specification in the United States without a license to the '321  
 24 patent. A copy of the letter is attached as Exhibit 7.

25 28. Tigo's 2021 letter (Exhibit 7) informed SunSpec that Tigo was willing to license the  
 26 '321 patent to SunSpec members, and that Tigo would be willing to resolve the matter of SunSpec's  
 27 infringement amicably if SunSpec would notify its members that they need a license from Tigo to  
 28 import, make, use, sell, or offer to sell rapid shutdown devices that adhere the RSD Specification.

1       29. On or about June 21, 2021, Tigo again notified SunSpec that it was inducing its  
 2 members to infringe Tigo's '321 patent, and that SunSpec's members needed a license to the same  
 3 to manufacture, use, import, sell, or offer to sell rapid shutdown devices that adhere to the RSD  
 4 Specification. A copy of the letter is attached as Exhibit 8.

5       30. SunSpec again declined to encourage its members to obtain a license from Tigo.  
 6 Instead, in July 2021 SunSpec filed an *inter partes* review ("IPR") proceeding with the Patent Trial  
 7 and Appeal Board (the "Board") of the United States Patent and Trademark Office (IPR2021-  
 8 01286) in an effort to invalidate claims of the '321 patent that are necessary to the RSD  
 9 Specification. In the IPR, Sunspec listed several of its members as "Real Parties-in-Interest" to the  
 10 proceeding.

11       31. After the IPR was instituted, but long before it was decided, SunSpec issued a press  
 12 release (see <https://sunspec.org/inter-partes-review/>). The press release contends that Tigo's '321  
 13 patent is invalid and lauds the Patent Office for instituting SunSpec's IPR petition against the '321  
 14 patent. A copy of the press release is attached as Exhibit 9.

15       32. On January 26, 2023, the Patent Office issued a Final Written Decision in SunSpec's  
 16 IPR. The Final Written Decision is attached as Exhibit 10. The Final Written Decision rejected  
 17 SunSpec's invalidity positions, holding that none of the claims that SunSpec challenged in Tigo  
 18 '321 patent were unpatentable.

19       33. Notwithstanding this decision, on or about January 30, 2023, SunSpec published a  
 20 press release titled "Patent Office Invalidates Tigo Energy, Inc.'s Patent Claims" (see  
 21 <https://sunspec.org/patent-office-invalidates-tigo-energy-inc-s-patent-claims/>). A copy of this press  
 22 release is attached as Exhibit 11.

23       34. Near the end of the press release, SunSpec acknowledged that the Patent Office  
 24 decided not to invalidate "certain other challenged claims of the ... '321 patent":

25       The Patent Office ultimately declined to cancel certain other challenged claims of the '770 and '321 patents in its decisions  
 26 today. SunSpec is still considering its options with respect to these claims, including the possibility of appealing the  
 decisions on those claims.

27 (Ex. 11.)

28       35. However, SunSpec failed to acknowledge that the Patent Office decided not to

1 invalidate *any* claims in SunSpec's challenge against the '321 patent.

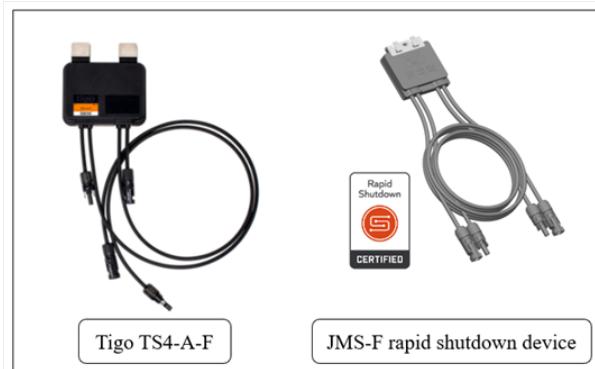

2 36. On information and belief, SunSpec sent out emails providing the content of the  
3 press release to all of its members.

4 37. On information and belief, SunSpec also made announcements on social media  
5 pushing the content of the press release to its members.

6 38. The January 30, 2023 press release and the communications that SunSpec sent to its  
7 members do not suggest that a license from Tigo for the '321 patent is needed to adhere to the RSD  
8 Specification. Instead, the January 30 press release and the communications that SunSpec sent to its  
9 members misleadingly imply that SunSpec was successful in invalidating Tigo's patent claims  
10 related to the RSD Specification, thereby suggesting that a license to Tigo's '321 patent is not  
11 needed.

12 39. On information and belief, SunSpec and at least some of its members copied Tigo's  
13 product line and Tigo's patented technology in developing the RSD Specification and in making,  
14 using, selling and/or offering for sale products that enable photovoltaic systems to comply with the  
15 rapid shutdown requirements of National Electric Code § 690.12 by infringing Tigo's '321 patent.  
16 For example, the webpage <https://www.sma-america.com/products/sunspec-certified-rapid-shutdown-technology.html> states that "SMA inverters paired with SunSpec certified rapid shutdown  
17 technology are the simplest, most reliable way to achieve compliance with NEC 2017 while  
18 producing more energy than traditional optimizers."

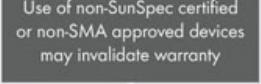

20 40. As one particular set of examples, SMA's products include the JMS-F rapid  
21 shutdown device pictured below right. Like Tigo's TS4-A-F, the JMS-F rapid shutdown device is a  
22 module-level rapid shutdown unit that is attached to individual photovoltaic panels.

1 See, e.g., <https://www.sma-america.com/products/sunspec-certified-rapid-shutdown-technology/jms-f-sunspec-rapid-shutdown-device.html>.

3 41. SMA's products also include inverters, including for example the Sunny Boy 3.0-US / 3.8-US / 5.0-US / 6.0-US / 7.0-US / 7.7-US, the Sunny Tripower Core1 33-US / 50-US / 62-US, and the Sunny Tripower X 20-US / 25-US / 30-US ("SMA inverters") which employ "SunSpec rapid shutdown technology" and are specifically designed and advertised to be used in combination with a rapid shutdown device, including the JMS-F rapid shutdown device.

8 **SMA APPROVED  
9 SUNSPEC CERTIFIED  
10 RECEIVER/INVERTER  
11 COMBINATIONS**

SUNNY BOY-US-41	SUNNY TRIPOWER CORE1-US-41
  	 
  	 
  	 
<p>For up-to-date information on SMA's Approved SunSpec Certified Rapid Shutdown Equipment List please visit:  <a href="https://www.SMA-America.com/products/sunspec-certified-rapid-shutdown-technology.html">https://www.SMA-America.com/products/sunspec-certified-rapid-shutdown-technology.html</a></p>	

22 <https://www.sma-america.com/products/sunspec-certified-rapid-shutdown-technology.html>.

23 42. Like the Tigo RSS Transmitter, the SMA inverters provide a watchdog signal, e.g., a  
24 SunSpec signal, to a rapid shutdown device, e.g., the JMS-F shutdown device, for rapid shutdown  
25 along the powerline to enable a photovoltaic system that complies with NEC § 690.12. For example:

26

- 27 • Exhibit 12, JMS-F Rapid Shutdown Box Ver 3.0 Installation Manual ("JMS-F  
28 Installation Manual") at 5 ("The signal is transmitted by the inverter with  
built-in transmitter function through the DC bus. . . . When an emergency

1 situation occurs, the AC power can be turned off by switching the AC breaker  
 2 in the cabinet, so that the inverter with built in transmitter function stops  
 3 sending signals, and the JMS-F will shutdown power output . . .”), 10-12;  
 4

- Exhibit 13, Sunny Boy 3.0-US / 3.8-US / 5.0-US / 6.0-US / 7.0-US / 7.7-US  
 5 Datasheet (“Sunny Boy Datasheet”) at 3 (“The SMA Energy System Home  
 6 combines legendary SMA inverter performance and SunSpec certified  
 7 shutdown devices in one cost-effective, comprehensive package . . . . This  
 8 rapid shutdown solution fulfills UL 1741, NEC 2014, and NEC 2017  
 9 requirements and is certified to the power line-based SunSpec Rapid  
 10 Shutdown communication signal over DC wires, making it the most simple  
 11 and cost-effective rapid shutdown solution on the market.”);  
 12
- Exhibit 14, Sunny Boy 3.0-US / 3.8-US / 5.0-US / 6.0-US / 7.0-US / 7.7-US  
 13 Installation Manual (“Sunny Boy Installation Manual”) at 20 (“A complete  
 14 PV Rapid Shutdown System consists of the inverter, PV array disconnect  
 15 switches, and a Rapid Shutdown initiation device. The Rapid Shutdown  
 16 initiation device serves to initiate a rapid shutdown. The PV Rapid Shutdown  
 17 System must limit the DC conductors to < 30 V within 30 seconds.”).  
 18

19 43. On information and belief, SMA has made, used, sold, offered to sell, imported,  
 20 installed and/or has had installed the JMS-F rapid shutdown device and/or SMA inverters.  
 21

22 44. Despite knowing that a license to Tigo’s ’321 patent is required to use the RSD  
 23 Specification, and despite knowing that the Patent Office rejected its IPR challenge to the validity of  
 24 Tigo’s ’321 patent, SunSpec has been actively inducing its members to adhere to the RSD  
 25 Specification without obtaining a license to Tigo’s ’321 patent. In so doing, SunSpec is violating  
 26 Tigo’s patent rights under U.S. patent law, specifically 35 U.S.C. § 271(b), which states that  
 27 “Whoever actively induces infringement of a patent shall be liable as an infringer.”  
 28

29 45. SunSpec has also been directly or indirectly infringing Tigo’s ’321 patent by testing  
 30 and certifying its members’ products as being compliant with the RSD Specification.  
 31

32 **COUNT I**

33 **(INFRINGEMENT OF U.S. PATENT NO. 8,933,321)**

34 46. Tigo repeats and realleges paragraphs 1-45 as if fully set forth at length herein.  
 35

36 47. On January 13, 2015, the United States Patent and Trademark Office duly and  
 37 legally issued the ’321 patent. Tigo is the owner and assignee of all substantial rights in the ’321  
 38 patent, including the right to enforce the ’321 patent.  
 39

1       48.    Each individual claim in the '321 patent recites an independent invention. No  
 2 individual claim is representative of all claims in the '321 patent.

3       49.    SunSpec has had knowledge of the '321 patent since at least October 2017 when it  
 4 was informed by Tigo that the '321 patent was necessary to the SunSpec RSD Specification.

5       50.    SunSpec has also had knowledge since at least October 2017 that products adhering  
 6 to the RSD Specification infringe at least claims 1 and 12 of the '321 patent. Despite this  
 7 knowledge, SunSpec actively, knowingly, and intentionally induced its members to use the RSD  
 8 Specification, and to make, use and sell products adhering to the RSD Specification. For example,  
 9 SunSpec has published and provided the RSD Specification to its members with the knowledge and  
 10 specific intent that its members make, use, sell, offer to sell, and import products that adhere to the  
 11 RSD Specification despite SunSpec's knowledge that doing so infringes at least claims 1 and 12 of  
 12 Tigo's '321 patent, literally or under the doctrine of equivalents.

13       51.    SunSpec has also induced infringement by its members by issuing press releases and  
 14 disseminating the same to its members in relation to attempts to invalidate claims in Tigo's '321  
 15 patent. For example, SunSpec induced infringement by its members through the publication of a  
 16 "prior art synopsis" that claimed that its "purpose" is establishing that the technology comprising the  
 17 standard of the RSD Specification "was invented or discovered years or even decades ago and are in  
 18 the public domain." SunSpec knew of Tigo's '321 patent and intended to induce its members to  
 19 continue infringing Tigo's '321 patent by suggesting that prior art would render Tigo's claims  
 20 invalid or otherwise unenforceable. As detailed above, SunSpec challenged Tigo's '321 patent in an  
 21 IPR and failed to show that any claims in the '321 patent were unpatentable.

22       52.    SunSpec's knowledge and intent to induce infringement of the '321 patent is also  
 23 evidenced by its IPR filing related to the '321 patent and subsequent press releases. After learning of  
 24 the results of its IPR, SunSpec disseminated a press release to its members touting those results as a  
 25 victory for SunSpec, as described above. But the Patent Office specifically held that SunSpec failed  
 26 to demonstrate that any challenged claim in Tigo's '321 patent was unpatentable. Despite full  
 27 knowledge of this outcome, SunSpec's press release touted the IPR results as a victory for SunSpec.  
 28 This was egregious given that adhering to the RSD Specification without a license from Tigo is

1 infringing conduct. Touting the results of its IPR as a victory for SunSpec intentionally  
 2 mischaracterizes the result of the IPR on the '321 patent and incorrectly suggests to SunSpec's  
 3 members that they may adhere to the RSD Specification without a license from Tigo.

4       53. SunSpec's members have and continue to directly infringe at least claims 1 and 12  
 5 of the '321 patent in the United States. In particular, practicing the SunSpec RSD Specification  
 6 directly infringes the '321 patent. Below, Tigo shows that (1) practicing the SunSpec RSD  
 7 Specification directly infringes claim 1 of the '321 patent and (2) SMA directly infringes claim 1 of  
 8 the '321 patent.

9       54. Upon information and belief, SMA makes, uses, sells, offers for sale, and/or imports  
 10 into the United States infringing products that practice each limitation of at least claim 1 of the '321  
 11 patent.

12       55. Upon information and belief, SMA and other members practicing the SunSpec RSD  
 13 Specification directly infringe at least claim 1 of the '321 patent under 35 U.S.C. § 271(a), literally  
 14 and/or under the doctrine of equivalents, by making, using, offering for sale, selling, and/or  
 15 importing products that practice the RSD Specification in the United States.

16       56. Claim 1 of the '321 patent recites:

17       A system comprising:

18       a watchdog unit coupled between a solar module and a power bus, the power bus configured  
 19       to connect a plurality of solar modules to an inverter, the watchdog unit having:

20       a local controller configured to monitor a communication from a central controller remote  
 21       from the solar module and determine whether the communication has been interrupted  
 22       for a time period longer than a predetermined number of allowed skips; and

23       at least one switch configured to disconnect the solar module from the power bus in  
 24       response to a determination by the location controller that the communication from the  
 25       central controller has been interrupted for a time period longer than the predetermined  
 26       number of allowed skips;

27       wherein the watchdog unit is configured to connect the solar module to the power bus when  
 28       the communication is not interrupted.

29       57. Claim 12 of the '321 patent recites:

30       12. A system comprising:

31       a watchdog device coupled between a solar module and a power bus, the power bus

1 configured to connect a plurality of solar modules to an inverter, the watchdog device  
 2 configured to:

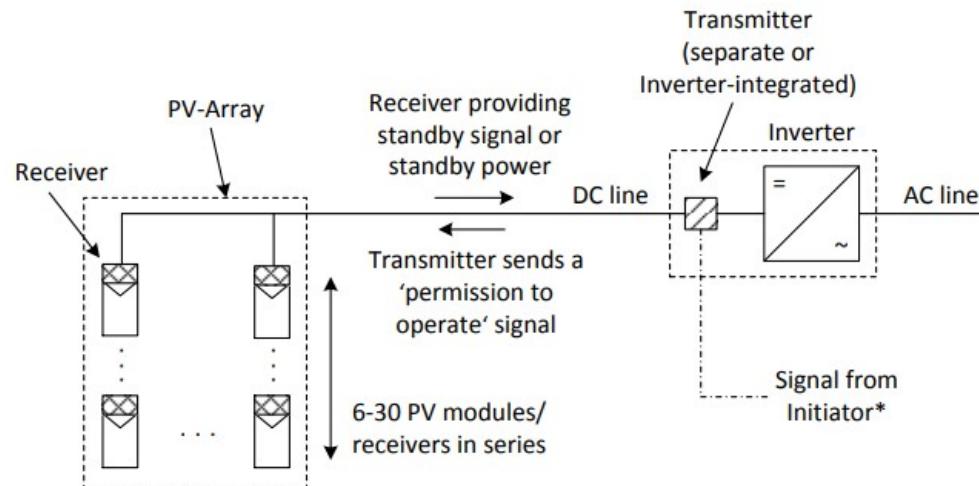

3 verify communication with a central controller remote from the solar module; and  
 4 shutdown the solar module from the power bus if communication with the central controller  
 5 cannot be verified for a time period longer than a predetermined number of allowed  
 6 skips.

7 58. Direct infringement at least claims 1 and 12 of the '321 patent occurs when SunSpec  
 8 and/or its members practice the SunSpec RSD Specification. Practicing the RSD Specification  
 9 involves using a system in which a watchdog unit (e.g., a "receiver" in the figure below) is coupled  
 10 between a solar module (one of the "6-30 PV modules... in series" in the figure below) and a  
 11 power bus, where the power bus configured to connect a plurality of solar modules (the "6-30 PV  
 12 modules... in series") to an inverter and a transmitter (which may be separate from or integrated in  
 13 an inverter):

### 3.1 System Configuration

14 A Rapid Shutdown System is a collection of Components and Communicati  
 15 are used to fulfill rapid shutdown requirements as defined by NEC 2014 or  
 16 Components of a rapid shutdown communication system are Initiator(s),<sup>1</sup> and Receiver(s).

17 The SunSpec Communication Signal for Rapid Shutdown Specification is de  
 18 support rapid shutdown requirements of any PV system governed by NEC  
 19 or applicable UL standard(s), irrespective of system configuration. Issues t  
 20 affect application protocol performance, such as cross-talk from other prot  
 21 line impedance, must be accounted for.

27 (Ex. 2 at 11.)  
 28

1       59. Practicing the RSD Specification involves a local controller configured to monitor a  
 2 communication (e.g., a SunSpec signal) from a central controller (transmitter in Figure 1 of the RSD  
 3 Specification, reproduced above) remote from the solar module and determine whether the  
 4 communication has been interrupted for a time period longer than a predetermined number of  
 5 allowed skips:

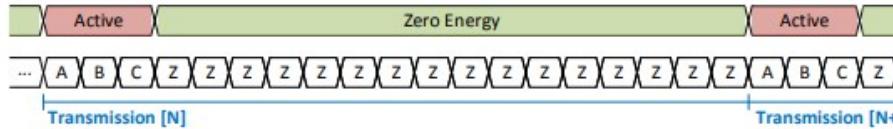

#### 6           **4.5 Mode Transition Parameters**

7           The following values and parameter ranges are **Requirements** of the M  
 8           attributes of this specification.

9           Symbol	10          Mode Specification	11          Min.	12          Max.	13          Unit	14          Rema

**Table 6 Power Line Communication Values**

### Table Footnotes

1. Sequences shall be transmitted in left-to-right order {b1, b2, l followed by bit 3 etc.
2. Code words are transmitted continuously in a repetitive, cyc signaling bits nor additional time delay inserted between the
3. Code sequences without permission to operate can be sent du code sequences with permission to operate shall only be sent shutdown is not active. If there is no functional indication to permission to operate, the code sequence A B C = W<sub>1</sub> W<sub>2</sub> W<sub>3</sub> n
4. Reserved code sequences are for future use by this standard.
5. Receiving a code sequence without permission to operate is n to be treated like there was no permission to operate signal rec
6. All frequencies and durations are subject to  $\pm 100$  ppm tolera transmitter.
7. Receivers shall perform within SunSpec specification limits f the transmitter that lie within the allowable  $\pm 100$  ppm tolera
8. Receivers may assume that transmitted bit rate and Mark/Sp derived from the same original clock source).

(Ex. 2 at 22-23.)

### 3.2.2. Receiver in-band interferer rejection

The test shall be performed according to figure 3.1 (or 3.2 for multi-module RSDs). The interfering signal is a CW tone sent with a varying frequency between 120kHz and 155kHz according to table 3.2 and Figure 3.4.

It has to be noted that CW blockers at FM and FS are included in this test. The goal is to test that the architecture of the receiver is immune to any single tone blocking signal right at FS or FM.

(Ex. 3 at 12; *see also* Ex. 3 at 12-13 (“Test-1: ON-state, the RSD must stay ON in the presence of interferer”); Ex. 2 at 19 (“Requirement: Receiver(s) must indicate the absence of permission to operate signals without any false alarms over at least one hundred (100) hours observation period in the presence of a standardized noise and interference test signal as specified in the SunSpec Rapid Shutdown Compatibility Test Plan”); Ex. 2 at 13 (“NEC 2017 specifications require the illuminated PV generators and complete PV system to be de-energized to a maximum when in the Shutdown Mode. Instead of completely zeroing output power capability, the receiver must provide a non-zero output voltage and current within the range offered as allowable by NEC 2017.”).

60. As shown above, the cycle period for the permission-to-operate signal is 1.07 seconds, and the time for the receiver to de-energize its PV power sources is 13 seconds. This shows that the RSD specification uses a time period longer than a predetermined number of allowed skips of the permission-to-operate signal. This is confirmed by the requirement that the receiver be immune to any single tone blocking signal and that it operate without any false alarms.

61. Practicing the RSD Specification involves having at least one switch configured to disconnect the solar module from the power bus (e.g., cause a rapid shutdown) in response to a determination by the location controller that the communication (e.g., a SunSpec permission-to-operate signal) from the central controller (e.g., transmitter) has been interrupted for a time period longer than the predetermined number of allowed skips:

Receiver	The equipment that is responsible for accepting the communication signal sent by a Transmitter and is capable of initiating a state change of PV power source components based on the signal received. (see Section 3.1 of this document)
----------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

(Ex. 2 at 9; see also Ex. 2 at 15, 21-23 (reproduced above).)

## Receiver

A Receiver is the equipment that is responsible for accepting the communication signal sent by a Transmitter and is capable of initiating a state change of PV power source components based on the signal received.

### 3.1.5 Requirement: A Sub-system must have at least one Receiver.

## Transmitter/Receiver Interactions

Transmitter/Receiver interactions are at the heart of Communication Signal for Rapid Shutdown operation. By optimizing for efficiency and simplicity, low-cost and reliable system solutions are possible.

### 3.1.6 Requirement: A Transmitter must transmit a permission to operate signal to Receivers when the Initiator indicates rapid shutdown is not active.

### 3.1.7 Requirement: A Transmitter must stop transmitting a permission to operate signal to Receivers when the Initiator indicates rapid shutdown is active.

**3.1.8 Requirement: A Receiver must be able to receive a permission to operate signal and initiate the ability of the associated power-producing equipment to produce power.**

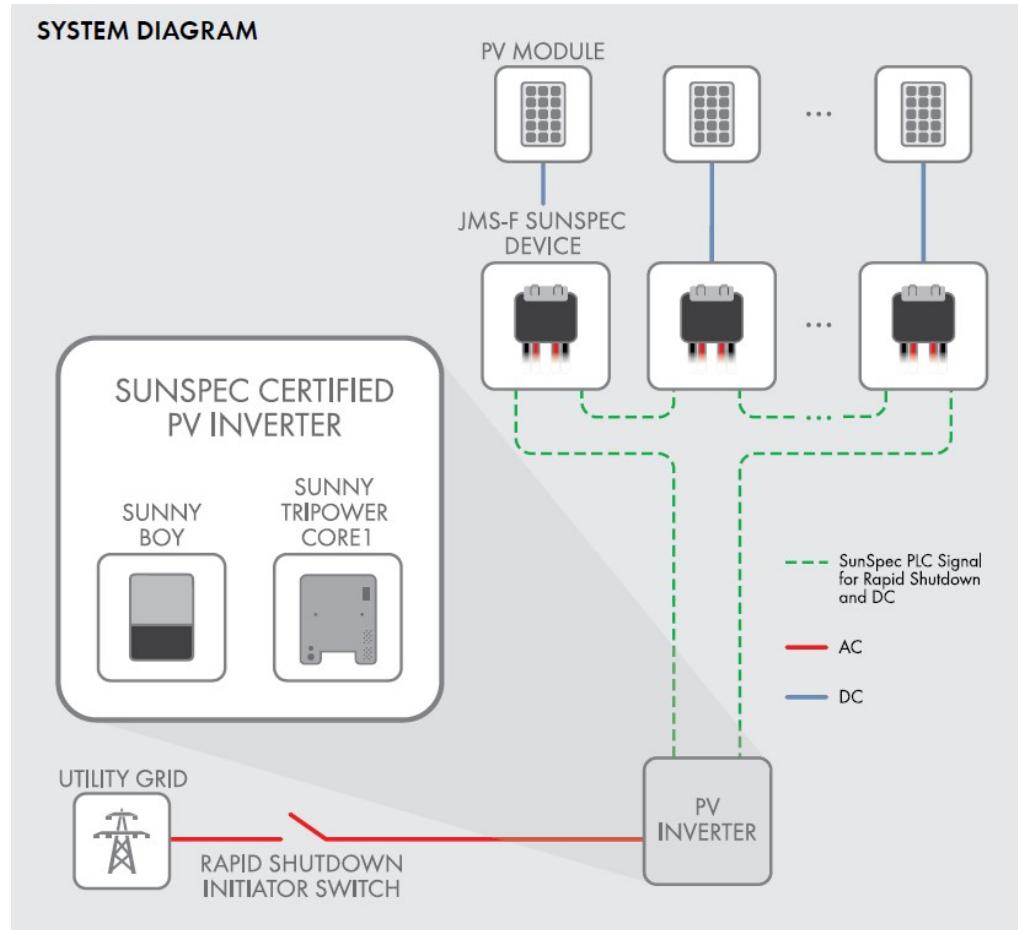

**3.1.9 Requirement: A Receiver must detect the absence of a permission to operate signal and initiate the shutdown of power production by associated power producing equipment.**

(Ex. 2 at 12.)

62. On information and belief, practicing the RSD Specification involves configuring a solar module to connect to the power bus when the communication is not interrupted as shown in Exhibit 2 and Exhibit 3, including specifically the excerpts cited above describing the “permission to operate” signal and Exhibit 3 at 12-13 (“Test-1: ON-state, the RSD must stay ON in the presence of interferer”).

63. The full extent of direct infringement induced by SunSpec is not presently known to Tigo. On information and belief, SunSpec members in addition to SMA have made, used, sold, offered for sale, and/or imported products under different names or part numbers that infringe the '321 patent in a similar manner.

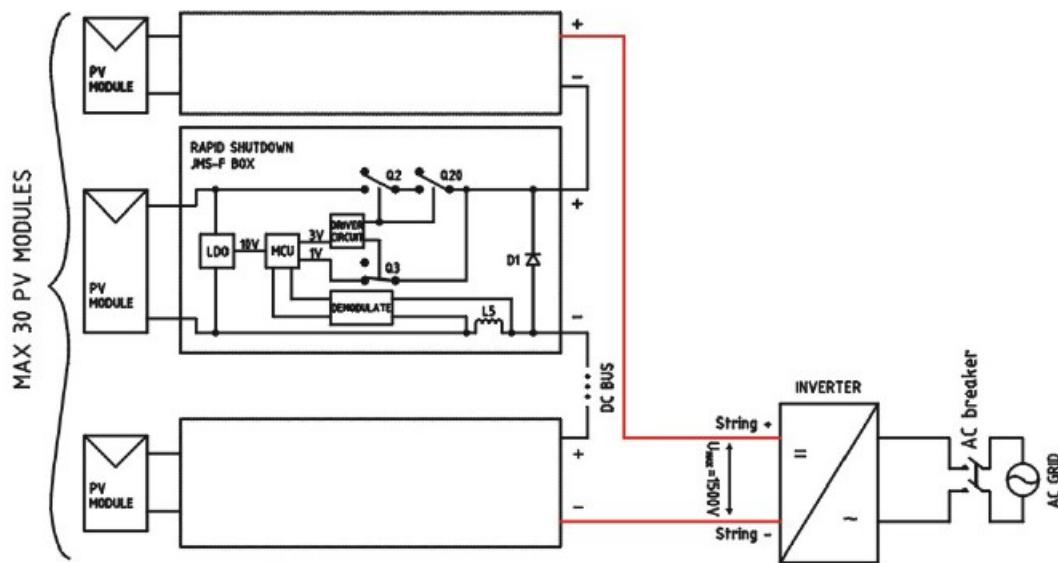

64. As a second non-limiting example of said infringement, on information and belief, the JMS-F device is part of a system in which it is a watchdog unit coupled between a solar module (e.g., PV module) and a power bus (e.g., DC lines shown in green below), the power bus configured to connect a plurality of solar modules to an inverter (e.g., the SMA inverter):

(Ex. 15, JMS-F Datasheet at 2.)

65. On information and belief, the JMS-F comprises a local controller configured to monitor a communication (e.g., a signal such as a SunSpec signal) from a central controller remote from the solar module (e.g., the SMA inverter) and determine whether the communication has been interrupted for a time period longer than a predetermined number of allowed skips:

## 1 6. Initiating Rapid Shutdown

12 When the AC breaker is turned off, the inverter with built-in transmitter function stops  
 13 sending the signal "permission-to-operate" through the DC bus. JMS-F does not receive  
 14 the signal and waits for 10 seconds to enter the turn-off mode. Then the MOSFET Q3 is  
 15 activated and the MOSFET Q2/Q20 is deactivated, the output voltage of JMS-F is 1 Volt,  
 and the PV system is in the no-load state.

### 16 Rapid shutdown steps:

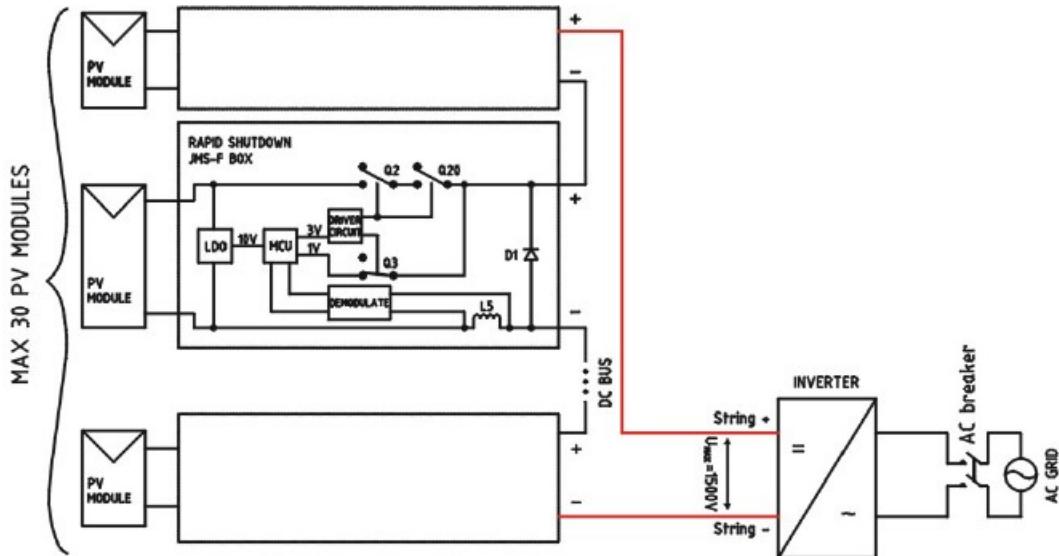

17 STEP1: Switch off the AC breaker on the AC side of the PV system.  
 18 STEP2: The inverter with built-in transmitter function stops sending signals, thus  
     initiating rapid shutdown.  
 19 STEP3: Each JMS-F does not receive the signal then executing rapid shutdown, the  
     output voltage of each JMS-F is 1 Volt.  
 20 STEP4: At the final stage the DC bus voltage of the PV system drops to below 30 Volts  
     within 30 seconds.

23 (Ex. 12, JMS-F Installation Manual at 11.)

24 66. On information and belief, the JMS-F comprises at least one switch configured to  
 25 disconnect the solar module from the power bus (e.g., cause a rapid shutdown) in response to a  
 26 determination by the location controller that the communication (e.g., a signal such as a SunSpec  
 27 signal) from the central controller (e.g., the SMA inverter) has been interrupted for a time period

1 longer than the predetermined number of allowed skips:

2 **6. Initiating Rapid Shutdown**

When the AC breaker is turned off, the inverter with built-in transmitter function stops sending the signal "permission-to-operate" through the DC bus. JMS-F does not receive the signal and waits for 10 seconds to enter the turn-off mode. Then the MOSFET Q3 is activated and the MOSFET Q2/Q20 is deactivated, the output voltage of JMS-F is 1 Volt, and the PV system is in the no-load state.

**Rapid shutdown steps:**

STEP1: Switch off the AC breaker on the AC side of the PV system.

STEP2: The inverter with built-in transmitter function stops sending signals, thus initiating rapid shutdown.

STEP3: Each JMS-F does not receive the signal then executing rapid shutdown, the output voltage of each JMS-F is 1 Volt.

STEP4: At the final stage the DC bus voltage of the PV system drops to below 30 Volts within 30 seconds.

(Ex. 12, JMS-F Installation Manual at 11.)

67. On information and belief, the JMS-F is configured to connect the solar module to the power bus when the communication is not interrupted:

## 2. Function Description

The JMTHY JMS-F is qualified as PV rapid shutdown equipment (PVRSE) which can achieve module-level rapid shutdown. Which in turn will significantly improve the safety of PV power generation systems. JMS-F uses PLC communication. The signal is transmitted by the inverter with built-in transmitter function through the DC bus. After JMS-F receives the signal, the switch turns on and the energy generated by the PV module will be delivered to the AC grid through the inverter. When an emergency situation occurs, the AC power can be turned off by switching off the AC breaker in the cabinet, so that the inverter with built-in transmitter function stops sending signals, and the JMS-F will shutdown the power output, then eliminate the high voltage on DC bus, it can improve the safety of the PV system.

(Ex. 12, JMS-F Installation Manual at 5.)

68. The full extent of SunSpec's inducement of SMA's infringement is not presently known to Tigo. On information and belief, SunSpec has induced SMA to make, use, sell, offer for sale, and/or import products under different names or part numbers that infringe the '321 patent in a similar manner.

69. SunSpec has known of the '321 patent and intended for its members to infringe the '321 patent by adhering to the RSD Specification since at least October 2017.

70. Tigo has suffered and continues to suffer damages as a result of SunSpec's infringement of the '321 patent in an amount to be determined at trial.

71. Tigo has suffered and continues to suffer damages as a result of SunSpec's infringement of the '321 patent in an amount to be determined at trial.

72. SunSpec's infringement of the '321 patent is causing irreparable harm for which Tigo has no adequate remedy at law unless SunSpec is enjoined by this Court. Under 35 U.S.C. § 283, Tigo is entitled to a permanent injunction against further infringement of the '321 patent.

73. SunSpec's infringement of the '321 patent is willful and deliberate. SunSpec has been on notice that using the RSD Specification or infringes and SunSpec has continued to induce

1 infringement by its members despite SunSpec's knowledge that doing so infringes the '321 patent.  
 2 SunSpec's conduct in inducing infringement is also egregious in light of its posturing and  
 3 representations to its members regarding the validity of Tigo's patents, including the '321 patent, as  
 4 detailed above. As SunSpec has no good faith belief that it does not infringe the '321 patent, its  
 5 continued infringement is willful and deliberate, entitling Tigo to increased damages under 35  
 6 U.S.C. § 284 and to attorneys' fees and costs incurred in prosecuting this action under 35 U.S.C. §  
 7 285.

8 **JURY DEMAND**

9 74. Tigo hereby requests a trial by jury pursuant to Rule 38 of the Federal Rules of Civil  
 10 Procedure.

11 **PRAYER FOR RELIEF**

12 75. Tigo respectfully requests that the Court find in its favor and against SunSpec and  
 13 that the Court grant Tigo the following relief:

- 14 a. A judgment that SunSpec has infringed Tigo's '321 patent as alleged herein;
- 15 b. A permanent injunction against SunSpec and their affiliates, subsidiaries, assignees,  
 employees, agents or anyone acting in privity or concert with them from further  
 infringement of the '321 patent, including enjoining the inducement of others to  
 make, use, sell, or offer for sale products or systems that infringe any claim of the  
 '321 patent without a license from Tigo, until the expiration of the '321 patent.
- 16 c. A judgment for an accounting of all damages, past and future, sustained by Tigo as a  
 result of the acts of infringement by SunSpec;
- 17 d. A judgment and order requiring SunSpec to pay Tigo damages under 35 U.S.C. §  
 284, including up to treble damages as provided by 35 U.S.C. § 284, and any  
 royalties determined to be appropriate;
- 18 e. A judgment and order requiring SunSpec to pay Tigo pre-judgment and post-  
 judgment interest on the damages awarded;
- 19 f. A judgment and order finding this to be an exceptional case and requiring SunSpec  
 to pay the costs of this action (including all disbursements) and attorneys' fees as

1 provided by 35 U.S.C. § 285; and

2 g. Such other and further relief as the Court deems just and equitable.

3 Dated: February 21, 2023

Respectfully submitted,

4 /s/ Nicholas Brown
